Research Interests

My research characterizes and quantifies how clouds respond to changes in aerosol loading and meteorological conditions driven by human activity and natural climate variability. Building on this, I seek to understand how these cloud responses shape the increasing Earth's energy imbalance and constrain the viability and risks of proposed climate interventions. To address these multiscale questions, I leverage satellite and field observations, atmospheric and Earth system modeling, and data-driven approaches to extract physical understanding of the processes linking clouds to a changing climate.
